

Cellular Signal Boosters

If you are experiencing Bad Cellular Signals in your business, it's typically not your carrier, but your environment. More specifically, it's your building. If you have Metal, Concrete, or Insulated Glass in your building, they all block cellular signals. Signal strength is so varied geographically that service can differ even from room to room in the same building. Metropark has the solution to solve your signal issues.

How We Do It!

1

CELL TOWER

The Cell Tower transmits and receives the cellular signal

2

OUTSIDE DIRECTIONAL ANTENNA

The signal is received and transmitted by the Outside Antenna

3

BOOSTER EQUIPMENT

Our booster amplifies the cellular signal(s) and sends them to the Inside Antenna(s)

4

INSIDE ANTENNA

The Inside Antenna broadcasts the boosted signal to devices inside the building

5

ADDITIONAL HARDWARE

Additional Antenna/Hardware can be added for Multi-Antenna Installation
